Vacuum packaging in an oxygen impermeable package will exclude most of the oxygen, thus reducing oxidation and off-flavors and retarding the growth of microorganisms that require oxygen for growth (aerobe). This will significantly extend the shelf life of refrigerated, frozen, and dried foods. Vacuum packaging changes the color of muscle tissue.

Vacuum packing is a method of packaging that removes air from the package prior to sealing. This method involves placing items in a plastic film package, removing air from inside and sealing the package. Shrink film is sometimes used to have a tight fit to the contents. The intent of vacuum packing is usually to remove oxygen from the container to extend the shelf life of foods and, with flexible package forms, to reduce the volume of the contents and package. Vacuum packing reduces atmospheric

limited due to chemical effects of atmospheric oxygen and the aerobic microorganisms. Vacuum packing has become popular as a protection technique during refrigeration. Shelf life quality of aquatic food products can be improved by vacuum packing technique. Moreover, the microbial ecology of food basically depends

Vacuum packaging is another way to increase the shelf life of food products. Here the product is placed in an air-tight pack, the air sucked out and the package sealed. By removing air from around the product, the levels of oxygen in the packaging are reduced, impeding the ability of oxygen-breathing microorganisms to grow and spoil the product.

Abstract. WOS: 000269367900004In this work, it was aimed to determine the effect of packaging technique on some quality properties of "Crottin de Chevignol" type goat cheese packaged under vacuum (VP) and modified atmosphere (MAP) (%20 CO2 + %80 N-2) during storage at + 4 degrees C and also to compare these two packaging techniques to be able determine the more suitable packaging technique for ...

To reduce the chance of spoiling, you need to either use the food fairly soon after buying it, or you need to store it. Vacuum packing can help store food for longer periods of time more safely and efficiently. There are some disadvantages to vacuum packing that you need to consider before purchasing a vacuum packager.

Packaging at reduced oxygen pressure and vacuum packaging are effective means of prolonging the oxidative stability of meat products such as precooked chill-stored, or freezer stored, sliced products.

*Modified Atmosphere Packaging – an overview ...*

Vacuum sealing greatly extends the lifespan of many different kinds of food, from cheese to meat to soup. For example, by using traditional methods, meat will typically last about 6 months in the freezer. However, vacuum sealed meat will last 2-3 years in the freezer.

After CO2-pack opening the meat colour became bright red and R630- R580 measurements were high, whereas after opening of vacuum packaging R630-R580 decreased rapidly with increasing aerobic exposure. High-pH meat became paler with increasing storage time in CO2. Simultaneously R630-R580 values increased and the pH fell.

Vacuum packaging which prevents oxidation can ensure that meat rests on shelves for five to eight days, as opposed to two to four. The machinery required to create vacuum packaging isn't cheap, but isn't astronomically priced either, costing a few hundred thousand. Further to this, consumers might actually prefer this method.

Vacuum packing of fish is often carried out in conjunction with one of these methods, but it can be done on its own. Vacuum packing is simple to do at home if you use the correct equipment. A vacuum sealer machine sucks all the air (oxygen) out of the vacuum bag and then heat seals it. It's easy to use and small enough for domestic use.
