This guide is a resource for paediatricians' interactions with parents as well as local child care providers, which should help to promote the health and safety of children in these settings.

How we raise young children is one of today's most highly personalized and sharply politicized issues, in part because each of us can claim some level of "expertise." The debate has intensified as discoveries about our development-in the womb and in the first months and years-have reached the popular media. How can we use our burgeoning knowledge to assure the well-being of all young children, for their own sake as well as for the sake of our nation? Drawing from new findings, this book presents important conclusions about nature-versus-nurture, the impact of being born into a working family, the effect of politics on programs for children, the costs and benefits of intervention, and other issues. The committee issues a series of challenges to decision makers regarding the quality of child care, issues of racial and ethnic diversity, the integration of children's cognitive and emotional development, and more. Authoritative yet accessible, *From Neurons to Neighborhoods* presents the evidence about "brain wiring" and how kids learn to speak, think, and regulate their behavior. It examines the effect of the climate-family, child care, community-within which the child grows.

Well child care is designed to promote optimal health status for children, including school and life success. This preventive care includes anticipatory guidance; continuity of care; assessment of growth and development; screening procedures for vision, hearing, dental, and cognitive development; and immunizations. Anticipatory guidance provides parental health education, counseling, and reassurance. The vast majority of Medicaid-insured children receive fewer than the American Academy of Pediatrics (AAP) recommended number of well child visits in the preschool years, and a disproportionate number of children have poor health and lack school readiness. With little empirical data available indicating clinical effectiveness other than for immunizations, the AAP recommendations for well child care were originally based on consensus expert opinion, and more than three decades later, documentation of effectiveness remained unavailable. This information gap led policymakers to question the value of well child care and limited incentive to correct its underuse. Only in the last five years have experimental findings indicated an association between well child care and both more cost efficient health care and increased school readiness. Awareness of these findings by insurance company and Medicaid administrators is limited. The purpose for this book is to increase awareness by all stakeholders of the empirically determined clinical effectiveness of well child care. The short-term goal is to facilitate increased utilization of well child care, with a longer term goal of improved child health and life success.

Since publication of the fourth edition of this highly successful book, there have been a number of Government initiatives, reports and policies on how the health of children can best be protected and promoted. This revised fourth edition incorporates recent material on the National Service Framework, 'Every Child Matters', the public health report 'Choosing Health', and the Children Act. It has also been informed by new research on a variety of topics including Sure Start, obesity, Sudden Infant Death Syndrome (SIDS) and language acquisition. *Health for all Children 4/e* (revised) continues the themes of previous editions, in particular highlighting the growing evidence that behavioural problems and educational failure are not inevitable, and can be prevented. Thus the role of screening for developmental problems, while not ignored, is set in the context of what can be done to promote language development, reading, and enthusiasm for learning. Changes made to the fourth edition, and continued in this revised edition, include dealing with the health care needs of children of school age as well as pre-school children. It also outlines the needs of special groups of children, including those who are vulnerable or disabled and those living in unusual circumstances. The legislative

framework is outlined and hallmarks of good practice described. Promoting children's health is a key focus, with updated information on nutrition and injury prevention, and emphasis on the importance of parent education and support, language, and literacy skills, with a review of behavioural management programmes for parents. It also describes the duties laid on PCTs with regard to education and social services support. This established and successful book continues to be essential reading for all health professionals who work with children, whether in the community or at the receiving end of referrals. It will also provide vital background knowledge for those charged with the responsibility of planning, commissioning and monitoring. This revised fourth edition provides the most up to date evidence in a rapidly changing field.

Contains detailed abstracts of 41 articles that describe and evaluate intervention programs for families with young children. The interventions described here represent a wide variety of programs designed to promote positive child development (in terms of health and safety) and cognitive, physical, and social-emotional development. For each article, the specific intervention is described, the target population is identified, the method of evaluation is outlined, and the results are presented. In addition, there is a brief discussion of interpretations of the results, their implications for policy and research, and other comments.

Showcases the lives of parents with young children in the U.S. through the use of a national survey.
