Scientists strive to develop  
clear rules for naming and

grouping living organisms. But taxonomy, the scientific study of biological classification and evolution, is often highly debated. Members of a species, the fundamental unit of taxonomy and evolution, share a common evolutionary history and a common evolutionary path to the future. Yet, it can be difficult to determine whether the evolutionary history or future of a population is sufficiently distinct to designate it as a unique species. A species is not a fixed entity " the

relationship among the members of the same species is only a snapshot of a moment in time. Different populations of the same species can be in different stages in the process of species formation or dissolution. In some cases hybridization and introgression can create enormous challenges in interpreting data on genetic distinctions between groups. Hybridization is far more common in the evolutionary history of many species than previously recognized. As a result, the precise taxonomic status of an organism may be highly debated. This is the current case with the Mexican gray wolf (*Canis lupus baileyi*) and the red wolf (*Canis rufus*), and this report assesses the taxonomic status for each.

**The Sea Wolves** - Ian McAllister 2013-07-15

The Sea Wolves sets out to disprove the notion of "the Big

Bad Wolf," especially as it is applied to coastal wolves, a unique strain of wolf that lives in the rainforest along the Pacific coast of Canada. Genetically distinct from their inland cousins and from wolves in any other part of the world, coastal wolves can swim like otters and fish like the bears with whom they share the rainforest. Smaller than the gray wolves that live on the other side of the Coast Mountains, these wolves are highly social and fiercely intelligent creatures. Living in the isolated wilderness of the Great Bear Rainforest, coastal wolves have also enjoyed a unique relationship with man. The First Nations people, who have shared their territory for thousands of years, do not see them as a nuisance species but instead have long offered the wolf a place of respect and admiration within their culture. Illustrated with almost one hundred of Ian McAllister's magnificent photographs, The Sea Wolves presents a strong case for the importance of preserving the Great Bear

For six years Jim and Jamie Dutcher lived intimately with a pack of wolves, gaining their trust as no one has before. In this book the Dutchers reflect on the virtues they observed in wolf society and behavior. Each chapter exemplifies a principle, such as kindness, teamwork,

playfulness, respect, curiosity, and compassion. Their heartfelt stories combine into a thought-provoking meditation on the values shared between the human and the animal world. Occasional photographs bring the wolves and their behaviors into absorbing focus.

**The World of Wolves** - Luigi Boitani 2010

The grey wolf is one of the world's most polarizing and charismatic species.

Respected, adored, or held in awe by many as an icon of wilderness, wolves have also sparked fear and hatred when they have come into conflict with human presence. Wolves play a key ecological role by interacting with various prey species, which in turn influence other animal species and plants in the ecosystem. Not surprisingly, they are one of the most intensively studied mammalian species in the wild. The World offers a fresh and provocative look at current trends in wolf ecology and ecosystem management and conservation, Representative case studies, from

geographically and culturally diverse areas of the world, highlight the existing interconnections between wolves, their prey, their habitat, their ecosystems and people, and the role of science in wolf management and conservation. In addition, the studies involve many issues, for example genetics and hybridization of canids, wolf and prey dynamics and wolf depredation of livestock, that are entry points into larger aspects of ecology, evolution and conservation. This book will appeal to conservationists, scientists, wild life managers, and anyone seeking a better understanding of wolves and ecosystems, and of their co-existence with us. Contributors include recognized scientists and other wolf experts who introduce new and sometimes controversial findings. The World of Wolves included colour photographs of wild wolves by Peter A. Dettling, David C. Olson, and Robert J. Weselmann, and drawings by wildlife artist Susan Shimeld.

*The Hunter Chronicles* - Rick Parent 2017-08-08

Everyone loves wolves. Always having a dog or two in the family, Rick never experienced

"other animals" outside a zoo. In 1999 Rick married a true animal lover and owner of two more dogs for the family. That was the limit until synchronicity reared its head, putting Rick, his wife, and her children in a "drive-through" zoo on the first day they could sell the first of a recent wolf litter. This book is a diary of sorts to chronicle this chance meeting. He reluctantly purchased a five-week-old baby wolf that he would name "Hunter" a week later. These incredibly personal stories are a documentary of a rainbow of emotions as Rick and Hunter make their journey through life together. The life lessons that can be learned from this amazingly complex species are tools and a reference point for our position on the planet. The chronicles totally dispel the stereotypes about wolves and shed a humbling light on the most misunderstood species of all time. Everyone loves wolves, but Rick is blessed to have had a wolf love him.

**Family Groups** - Simon Rose

*Family Pack* - Sandra Markle  
2019-09-24

A real-life story of adaptation and survival. Acclaimed science writer Sandra Markle and celebrated artist Alan Marks team up for the fifth time in this fascinating real-life story of a wolf and her pack. Years ago, an effort had been made to eliminate wolves from Yellowstone National Park. Recently, conservationists decided to reintroduce the animal to the area, relocating wolves from Canada. *Family Pack* introduces readers to Female 7 and Male 2, the founders of the Leopold wolf

pack—the first naturally formed pack after the relocation effort. Readers follow Female 7 as she sets out on her own upon her release to the 2.2-million-acre area that is Yellowstone. Without the comfort of her mother or other wolves, the young female grows and learns to feed, hunt, and survive in her new home. Eventually, she crosses paths with Male 2, and the wolves form a family of their own. Back matter includes more information about wolves, a bibliography, and an author's note about the Leopold pack and the importance of reintroducing wolves to Yellowstone, restoring the natural balance.

#### The First Domestication -

Raymond Pierotti 2017-11-28  
A riveting look at how dog and humans became best friends, and the first history of dog domestication to include insights from indigenous peoples In this fascinating book, Raymond Pierotti and Brandy Fogg change the narrative about how wolves became dogs and in turn,

humanity's best friend. Rather than describe how people mastered and tamed an aggressive, dangerous species, the authors describe coevolution and mutualism. Wolves, particularly ones shunned by their packs, most likely initiated the relationship with Paleolithic humans, forming bonds built on mutually recognized skills and emotional capacity. This interdisciplinary study draws on sources from evolutionary biology as well as tribal and indigenous histories to produce an intelligent, insightful, and often unexpected story of cooperative hunting, wolves protecting camps, and wolf-human companionship. This fascinating assessment is a must-read for anyone interested in human evolution, ecology, animal behavior, anthropology, and the history of canine domestication.
